## Nomenclature

NR	G	D	02	A	014
Product Line	Motor Identifier	Width	# of Fans	Model Identifier	Standard Capacity
NR = Air-cooled Condenser with Microchannel Coil	G = 710 mm VSEC J = 710 mm AC	D = Dual	02 = 2	A = Current Revision	(MBH/Degree TD, R-404A)
			04 = 4		
			06 = 6		
			08 = 8		

## Features & Benefits

### Standard Features

- Microchannel heat exchanger
- R-404A, R-407A/F, R-407C, R-448A, R-449A, R-507, R-422D, and R-410A compatible
- 208-230/3/60 or 460/3/60
- Factory installed manifolding (Single circuit standard)
- 20" clearance legs
- Copper connection points with Schrader access valves
- NRG units are factory wired for customer supplied analog signal
- NRG units are direct acting, series wired motor control
- Through-the-door non-fused disconnect switch
- End access panels for coil-cleaning
- Internal baffles between all fan cells
- NRJ units come standard with individual motor fusing

### Optional Features

#### All Models

- 40" clearance legs
- Export crating

#### NRG Models

- Individual motor circuit breakers
- Individual motor fusing
- Factory installed analog board (CPC, Danfoss or Novar)
- Motor control & wiring
  - Direct acting (parallel wired)
  - Reverse acting (series or parallel wired)

- Proportional pressure control

#### NRJ Models

- Ambient fan cycling (electronic)
- Pressure fan cycling (mechanical or electronic)
- Microprocessor relay board (CPC, Danfoss or Novar)
- Control circuit transformer (230/115/24)

### Key Benefits

#### Refrigerant Charge Reduction

Microchannel coils offer a very high primary to secondary surface area ratio. This provides very efficient heat exchange while maintaining a low internal tube volume. As a result, the microchannel condenser reduces condenser refrigerant charge by over 70% (NRGD02A014 vs. BNED02A015).

#### Energy Efficient

The microchannel air-cooled condensers are available with variable speed EC motors, which vary speed based on system requirements to provide optimal energy and sound performance. These condensers are also available with VFD compatible AC motors.

#### Corrosion Resistance

The mono-metal construction of the microchannel coils virtually eliminates the risk of galvanic corrosion. A zinc cladding standard on all coils provides additional corrosion resistance for harsh environments.

#### Sound

Microchannel air-cooled condensers feature quiet variable speed EC fan motors as a standard. Optional VFD compatible AC fan motors are also available.

#### Lighter Weight

Over 20% lighter than comparable round-tube, plate fin air-cooled condensers.

#### Lower Height

Approximately 25% lower cabinet height (with same clearance) than comparable round-tube, plate fin condensers.

#### Structural Robustness

The coils used in this unit are extremely rigid and resistant to damage.

#### Warranty

Microchannel air-cooled condensers feature a standard 2 year product warranty and a 7 year warranty on the microchannel coil. The VFD compatible AC motors have a 2 year warranty while the variable speed EC motors come with a 3 year warranty.

#### Environmentally Friendly

100% recyclable, all -aluminum coil.

## Condenser Capacities &amp; Specifications

Model	Air Mover	Capacity (MBH/1°F)					Full Speed Airflow (ft <sup>3</sup> /min)	Flooded Refrigerant Charge (lbs)			Net Wt. (lbs)	Ship Wt. (lbs)	Coil Connection Sizes

# CONDENSER SELECTION

Capacity for air-cooled condensers are based on Total Heat of Rejection (THR) at the condenser. Total heat of rejection is equal to net refrigeration at the evaporator (compressor capacity) plus the energy input into the refrigerant by the compressor (heat of compression). The heat of compression will vary depending on the compressor manufacturer, type of compressor and the operating conditions of the compressor. Whenever possible, it is recommended that you obtain the heat of compression value from the compressor manufacturer.

If this is not available, the THR can be estimated using the following formula:

$$\text{THR} = (\text{Compressor Capacity}) * (\text{Heat of Compression Factor, Tables 1 \& 2})$$

Table 1 contains heat of compression factors for suction cooled compressors and Table 2 contains factors for open drive compressors. For refrigeration systems beyond the range of Tables 1 and 2, use the following equations to estimate THR:

## Open Compressors:

$$\text{THR} = \text{Compressor Capacity (BTUH)} + (2545) * (\text{Break Horsepower, BHP})$$

## Suction Cooled Compressors:

$$\text{THR} = \text{Compressor Capacity (BTUH)} + (3413 * \text{KW})$$

The compressor capacity is affected by its altitude. If the condenser location is above sea level, an additional correction is required to the THR, as follows:

$$\text{THR (altitude)} = \text{THR} * \text{Altitude Correction Factor, Table 3}$$

Selection Example

Compressor capacity:	270,000 BTUH
Evaporator temperature:	+25° F
Condensing temperature:	110° F
Ambient temperature	95° F
Refrigerant:	R-404A
Compressor type:	Semi-hermetic, suction cooled
Condenser type:	NRG
Condenser altitude:	1,000 feet

## Step 1: Estimate Condenser THR

From Table 1 for suction cooled compressors, at +25° F suction and 115° F condensing temperature, select a heat of compressor factor of 1.335.

$$\begin{aligned} \text{THR} &= \text{Compressor Capacity} * \text{Heat of Compression Factor} \\ &= 270,000 * 1.335 \\ &= 360,450 \end{aligned}$$

## Step 2: Correct for Altitude

From Table 3 obtain an altitude correction factor of 1.02 for 1,000 feet.

$$\begin{aligned} \text{THR} &= \text{THR (from step 1)} * \text{Altitude Correction Factor (design)} \\ &= 360,450 * 1.02 \\ &= 367,659 \end{aligned}$$

## Step 3: Calculate Design Condenser T.D.

$$\begin{aligned} \text{Design Condenser T.D.} &= \text{Condensing Temp} - \text{Ambient Temp} \\ &= 110^{\circ}\text{F} - 95 \\ &= 15^{\circ}\text{T.D.} \end{aligned}$$

## Step 4: Condenser Selection

Condenser capacities are located on page 4. These capacities are given in MBH/°TD. Convert the THR calculated in step 2 to MBH/°TD by dividing by 1,000 to get THR in MBH. Then divide the THR by the design TD to get MBH/°TD.

$$\text{THR (MBH)} = 367,659 / 1,000 = 367.7$$

$$\text{THR (MBH/°TD)} = 367.7 / 15 = 24.5$$

Locate the capacity column and read down until you locate a value equal to or just larger than 24.5. This value is 27.0. Read horizontally to the left to obtain a condenser model of NRGD04A027

## Step 5: Calculate Actual T.D. and Condensing Temperature

The actual condenser T.D. can be calculated by dividing the design THR by the condenser rating.

$$\text{Actual T.D.} = \text{THR (Design)} / (\text{Rating @ } 1^{\circ}\text{T.D.})$$

$$= 367.7 / 27.0$$

$$= 13.6^{\circ}\text{F T.D.}$$

The actual condensing temperature is the actual T.D. plus the ambient temperature.

$$\text{Actual Condensing Temperature} = (\text{Actual T.D.}) + (\text{Ambient})$$

$$= 13.6 + 95$$

$$= 108.6^{\circ}\text{F.}$$

\*Correction factors based on midpoint condensing temperature.

Table 1. Heat of Compression Factor for Suction Cooled Compressors

Suction Temp. °F	Condensing Temperature °F				
	90°	100°	110°	120°	130°
